

SUCCESSFUL DEBUT FOR LOGICDATA AT HANNOVER MESSE

Deutschlandsberg, May 4, 2026 – Mechatronics specialist LOGICDATA showcased its drive solutions for industrial applications for the first time at Hannover Messe in 2026. This debut demonstrates that the company has established itself in the industrial sector with its new business unit.

At the trade show in April 2026, the company's brushless motor systems, parametrizable control boxes, and intelligent lifting columns were presented for the first time at an industrial trade show.

Special attention was given to the control boxes developed and manufactured by LOGICDATA, which are extremely flexible – they can be adapted to customer applications thanks to their easy configurability. In combination with the drive systems from JIECANG – the parent company of the Austrian company – easily configurable plug-and-play drive solutions are possible.

LOGICDATA's brushless motors can also be customized or used as standalone components. The motor technology, which was also showcased integrated into industrial columns, attracted a great deal of attention. These motors enable dynamic adjustment in industrial applications, thereby setting a new standard for production environments.

"With our brushless motor systems and intelligent lifting columns, we are setting new standards for flexibility and efficiency in industrial applications. Our drives are designed to execute dynamic movements with precision and reliability, thereby not only contributing to increased efficiency but also paving the way for future-proof production environments. Our presence at the Hannover Messe confirmed that our solutions are technically impressive and can be easily integrated into existing systems—a true game-changer for industrial companies."

Mathias Bratl, Team Leader Mechanics Development, LOGICDATA

Successful show for LOGICDATA & JIECANG at Hannover Messe 2026

For nearly 30 years, LOGICDATA has been developing market-leading mechatronic solutions for the industry, warehouse automation and furniture sector. Brushless motors, linear drives, intelligent lifting columns, and various control systems are designed for highest quality, seamless integration, and customization options. Customers benefit from the company's mechatronics expertise, which covers everything from development and series production to the management of the entire product lifecycle. Over 80 R&D experts work at the headquarters in Deutschlandsberg, Austria – more than 100 registered patents underscore the strong focus on research and development. The company operates its own production facility in Hungary and a location in North America.
